

HCL

1. Write a Python program which accepts a sequence of comma separated 4 digit binary numbers as its input and then check whether they are divisible by 5 or not. The numbers that are divisible by 5 are to be printed in a comma separated sequence. Example: 0100,0011,1010,1001 Then the output should be: 1010

Program

```
numbers = input().split()
result = []
for num in numbers:
    if int(num, 2) % 5 == 0:
        result.append(num)
print(','.join(result))
```

Output

The screenshot shows the OneCompiler Python IDE interface. The editor on the left contains the following Python code:

```
1 numbers = input().split()
2 result = []
3 for num in numbers:
4     if int(num, 2) % 5 == 0:
5         result.append(num)
6 print(','.join(result))
```

The right-hand side of the IDE shows the output in the Console tab. The input provided was "0011 1010 1100 1001", and the output displayed is "1010". The status bar at the bottom indicates the program is "Ready" and took "7.7s" to execute.

2. Write a Python program that accepts a sentence and calculate the number of letters and digits. Suppose the following input is supplied to

the program: hello world! 123 Then, the output should be: LETTERS 10 DIGITS 3

Program

```
letters = 0
digits = 0
for char in s:
    if char.isalpha():
        letters += 1
    elif char.isdigit():
        digits += 1
print("LETTERS", letters)
print("DIGITS", digits)
```

Output

3. Write a program which can compute the factorial of a given numbers. The results should be printed in a comma-separated sequence on a single line. Suppose the following input is supplied to the program: 8 Then, the output should be: 40320

Program

```
n=int(input())
fact=1
```

```
for i in range(1,n+1):  
    fact *= i  
print(fact)
```
